

Woolgar Gold Project

Ecological Survey & Management completed detailed baseline flora and fauna surveys for the proposed Woolgar Gold Project located in a remote area of north-west Queensland. The project is currently at the detailed exploration and mine planning stage.

The survey included detailed vegetation mapping and flora surveys. Fauna surveys were completed with a specific focus on complying with survey guidelines for threatened species such as the Northern Quoll, Black-throated Finch and Koala that were considered to potentially occur in the area. An intensive infra-red camera survey was conducted to target the Northern Quoll.

- Terrestrial flora and fauna surveys
- EPBC Act referrals and negotiations
- Offset assessment and management including Offset Management Plans
- Threatened species assessment and management
- Opportunities and constraints analysis
- Vegetation management plans
- Rehabilitation Plans
- Species Management Programs under the Queensland *Nature Conservation Act 1992*
- On-ground fauna management (spotter/catcher works)
- Development of environmental management plans for ecological protection.
